Introduction	xiii
Propagation and Planting	1
• A bit of deception helps me get some seeds to sprout that under natural conditions would wisely stay asleep	1
• Burial in tundra might be ideal for seed storage but I choose more practical storage for my vegetable and flower seeds	4
• Electricity temporarily suffices when access to sunlight is lacking	8
• In which the pre-plant toughening up of seedlings is shown to be necessary, but with a gentle touch	11
• Plants exhibit all sorts of changes, some sought after, some not, as they go through puberty	12
• A recommendation to plant citrus from seed even if fruit is improbable or not worth eating	15
• Containing some of the ways in which I use a few or many plant cells to conjure up whole new plants	17
• I revisit totipotency, using stems again, this time joining them to existing roots	21
• Neither monstrous nor scary, but often beautiful—yes, real chimeras may be in our midst	29
• Knowing that a bulb is, essentially, a stem lets me multiply them with the same “pinch” that makes stems branch	31

Soil	35
• In which we watch the progress of water traveling through soil, with methods to, at the same time, speed it up and slow it down.	35
• A common sense recommendation that turns out not to make sense	44
• Contains a description and an opinion of hydroponics	47
• In which I pay homage to humus, even though it may be a misnomer	49
• Wherein I check my ground's acidity and then tweak it, as needed	53
• On my ostensibly occult practice which turns out to be good gardening	59
• How I manage to tame nitrogen's comings and goings for my plants	62
• Even without squealing like hungry pigs, my plants can tell me if they're hungry, and for what	67
Flowering and Fruiting	73
• Sex is introduced and its sometime importance is emphasized	73
• In which I make right the products of plants' sexual excesses	76
• Describing the importance of night for coaxing blossoms, and a gardener's trickery	79
• In which a small gas molecule has a big effect on flavor	82
• Contains a question and an answer: is hybrid always high-bred?	85
Stems and Leaves	91
• In which my thumbnails, pruning shears, and branch bending coax plants into bushiness, lankiness, or anything betwixt	91

- Wherein I make designs with the trceries of my fruit plants' branches 97
- Questioning the advice to put the brakes on tree growth with summer pruning 101
- On the genesis, reason for, and propagation of weeping trees... 103
- A comfortable seat in a sunny spot gets trees and shrubs ready for winter... 107
- In which it is demonstrated that buds are not boring 109
- How buds become burls and witches' brooms 111
- On entreating and helping trees to stay asleep. 115
- About a quick and easy way to hasten spring 117
- Sunlight is important but sometimes shade offers improvement 120
- Organizations** 125
- Wherein families migrate together around my garden, and for good reason 125
- How plant families got put in order 129
- On Latin being a foreign tongue but providing a useful understanding of plant relationships 131
- Making up a new category name, fortunately, does not ruin flavor or appearance. 133
- Relating a true story about how my plants broke the law 135
- Stress.** 139
- On steps, human and otherwise, to avoid the havoc of icy cells during frigid temperatures 139
- In which hot days bring on a tug of war between hunger and thirst, in plants 142
- No water, no matter—because I take these steps for drought 146
- A very local search for congenial weather 148

- Seedlings' transition to the garden is helped along with tough love, timely and not in excess 150
- Unwanted plants—that is, weeds—are best understood before they are outwitted 153
- A sometime threat that straddles the fence between living and nonliving 156
- In which is clarified a name as a sign, rather than a symptom, of disease 159
- Fire blight, first noted not far from my home over 200 years ago, has the honor of being the first plant disease to be caused by bacteria. 163

- Senses** 169
 - In which I elucidate, abet, and alter the color of leaves, vegetables, and flowers 169
 - An Italian who tied together plant growth, art, and other things too innumerable to mention. 174
 - Here I make sense of scents, equally so for insects and humans 176
 - The touch here is that felt by the plants 179
 - And finally, the efforts I take to grow the best tasting fruits and vegetables 181

- Epilogue: The Scientific Method** 195

- Index** 201
- About the Author** 207
- About New Society Publishers** 208
